

# **Revenue and Costs for Illinois Grain Crops** Actual for 2018 through 2023, Projected for 2024 and 2025

College of Agricultural, Consumer & Environmental Sciences

UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

**Department of Agricultural and Consumer Economics** 

January 2025

#### Introduction

Gary Schnitkey and Nick Paulson Department of Agricultural and Consumer Economics University of Illinois

> Original release: September 2024 Revised: January 2025

This publication presents revenues and costs for producing corn, soybeans, wheat, and double-crop soybeans in three regions of Illinois: northern, central, and southern Illinois. Central Illinois is further divided into categories for high-productivity farmland and low-productivity farmland. Divisions between high and low farmland productivity are made based on soil productivity ratings. Generally, farms with higher soil productivity ratings have higher yields. Between 2019 and 2023, corn yields on high productivity farmland averaged 222 bushels per acre while corn yields on low productivity farmland averaged 208 bushels.

This publication includes ten tables:

- 1. Corn Revenue and Costs, Northern Illinois
- 2. Soybean Revenue and Costs, Northern Illinois
- 3. Corn Revenue and Costs, Central Illinois with High Productivity Farmland
- 4. Soybean Revenue and Costs, Central Illinois with High Productivity Farmland
- 5. Corn Revenue and Costs, Central Illinois with Low Productivity Farmland
- 6. Soybean Revenue and Costs, Central Illinois with Low Productivity Farmland
- 7. Corn Revenue and Costs, Southern Illinois
- 8. Soybean Revenue and Costs, Southern Illinois
- 9. Wheat Revenue and Costs, Southern Illinois
- 10. Double-Crop Soybean Revenue and Costs, Southern Illinois

Each table shows revenues and costs for 2018 through 2023. These financial results are summarized from grain farms enrolled in Illinois Farm Business Farm Management. Values for 2024 and 2025 are projections made based on expected yields, prices on futures exchanges, and input prices.

All revenues associated with crop production are included in the tables. Revenues include crop revenue, Agricultural Risk Coverage (ARC) payments, Price Loss Coverage (PLC) payments, other government payments (Market Facilitation Program payments and Coronavirus Food Assistance Program (CFAP) payments), and crop insurance payments. Crop revenue represents returns from marketed grain and equals yield times price per bushel. Price per bushel represents a market year average price that farmers received for grain. Crop insurance represents average indemnity payments from crop insurance.

Non-land costs are divided into 1) direct costs – costs that can be directly attributable to the production of the crop, 2) power costs – costs generally related to machinery

operations, and 3) overhead costs – costs associated with general operation of the farm. These costs are accrued so that they are associated with the year of production. For example, fertilizer costs for 2018 may have been incurred in 2017. Any fertilizer expense associated with 2018 production paid in 2017 is in the 2018 budget values.

Subtracting non-land costs from revenue yields "operator and land return". This is the return remaining to pay for farmland and provide a return to the operator. In a cash rent situation, the payment for farmland is cash rent. If the operator and land return is \$170 per acre and cash rent is \$150 then the farmer return is \$20 per acre.

An average land costs is included in this publication. Land costs represent a charge for use of the land. In this publication, land costs equal the average cash rent paid by farmers to land owners. This data is obtained from the Nationally Agricultural Statistical Service. Other means of controlling farmland, such as owning farmland or share-renting farmland, could have different costs.

Farmer return is then reported. Farmer return equals operator and land return minus land costs. This is the amount that farmers have to provide a return for unpaid labor, equity capital invested in the farm, and management. Farmer return is equivalent to net farm income per acre.

Acknowledgments: Much of the data used in these budgets comes from the local Farm Business Farm Management (FBFM) Associations across the State of Illinois. Without their cooperation, information as comprehensive and accurate as this would not be available for educational purposes. FBFM, which consists of 5,000 plus farmers and 60 professional field staff, is a not-for-profit organization available to all farm operators in Illinois. FBFM field staff provides on-farm counsel with computerized recordkeeping, farm financial management, business entity planning and income tax management. For more information, please contact the State FBFM Office located at the University of Illinois Department of Agricultural and Consumer Economics at 217-333-8846 or visit the FBFM website at www.fbfm.org.

#### Table 10. Double-Crop Soybean Revenues and Costs, Southern Illinois,

Actual for 2018 through 2023, Projected for 2024 and 2025.<sup>1</sup>

<sup>1</sup>Results for 2018 through 2023 are summarized from grain farms enrolled in Illinois Farm Business Farm Management. Projections are made for 2024 and 2025.

<sup>2</sup>Double crop soybeans are assumed to follow wheat. Land costs are included in the wheat budget for southern Illinois.
